

- HTML5 is an updated version of Hypertext Markup Language
- It is a programming language which is used to define the matter and appearance of web pages.
- Basically, HTML is used to create the text document on web page .
- HTML5 provide developers control over the performance of the webpage.
- HTML5 is now compatible with all popular browsers (Chrome, Firefox, Safari, IE9, and Opera).
- As a primary goal of HTML5, developers and browser makers may more easily adhere to consensus-based standards that are more efficient and empowering for all parties involved. Users on both desktops and mobile devices will benefit from the new look.
